

Why Saber-Tooth?

When you really need to get your teeth in, these brushes have the volume!
 Reposition the nylon tip or change the length of the rods to get the sound and volume you need. Play them like a regular brush aor turn the sideways to emphasize the tip and rod. These are the ultimate rock brush.

How to reposition the rod and or tip to achieve different sound ideas.

To move the rods: move O-rings 2 and 3 to position #1, this reduces friction and the rod can be adjusted in length.
 To secure in the desire position slide O-rings back to their starting position.

To move the tips: move the small O-rings in front and aft of the tip, slide to the tip a new desired position and return the O rings to be adjacent to the tip.
