

Why Cyclops?

The sound combinations are endless! Reposition the nylon tip, reposition the height or length of the rod, or reposition both! The rod or the tip will cut through the brush wires and contribute the exact amount rod tip sound you want on your drums or cymbals; giving you a balanced sound between these two contrasting sounds.

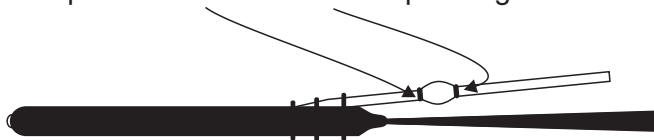

How to repositioning the rod and or nylon tip to achieve different sound ideas

To move the rod: move O-Rings #2 & #3 to #1, this reduces friction and the rod will now slide in or out.

To move the nylon tip: move the front or rear tip O-ring and slide the tip forward or backwards

To adjust height of rod: move all 3 height and positioning forward or backwards
